

BARRIER ASSESSMENT

Purpose

Assess potential factors contributing to low adoption of the existing digital intake workflow and identify which areas should be investigated or addressed during the pilot.

Assessment inputs

- Current-state workflow review
- Baseline operational data
- Staff confidence pulse data
- Stakeholder/role considerations
- Relevant healthcare digital-adoption evidence

Potential Barrier Assessment

ID	Potential Barrier	Evidence	Impact	Priority	Action
B-01	Workflow friction / unclear process steps	Workflow review; adoption remains below target	High	High	Review workflow and simplify friction points
	Staff confidence/uncertainty	Confidence baseline = 3.0/5	High	High	Staff pulse feedback + targeted support
	Manual/duplicate re-entry	15.4% of digital encounters at baseline required re-entry	High	High	Trace re-entry points and coordinate with IT
	Patient assistance needs	8.0% of eligible visits required assistance at baseline	Medium	High	Identify common assistance points and refine support
	Communication/change readiness	Adoption requires consistent staff understanding and support	Medium	Medium	Review communication and support approach
	Ownership/escalation clarity	Ongoing adoption requires operational ownership	Medium	Medium	Define owner and escalation path

Note: No real staff, patient, or clinic data were collected. Barrier categories were developed using project assumptions, simulated operational data, and external healthcare implementation literature. Potential barriers were treated as hypothesis to validate rather than as observed facts.
